

EnviroSmarts

Wireless Building Flood Protection System

Be Ready

EnviroSmarts protects your property from catastrophic flood damage with the most reliable wireless flood protection technology available. EnviroSmarts deploys a true dynamic wireless mesh into your building, from a single gateway, to protect all areas of your building from catastrophic floods. The flood sensors wirelessly communicate with each other providing an immediate response time with notification to building management, staff and automatic water shut off.

SOLUTION INCLUDES

A built-in rope sensor attachment to wrap pipes, cover larger and hard to reach areas.

- The wireless mesh includes optimized two-way communication, over-the-air software updates for the gateway and all the flood sensors with no data limits.
- Multilevel flood sensing eliminates false alarms.
- Detects flood, temperature, humidity and asset tracking.

PREDICTIVE & PREVENTATIVE MAINTENANCE

Water pressure sensors on the PRV stations to predict and alert potential PRV failure, leaks and floods.

The sensors also monitor mechanical equipment for how hot a motor or pump operates, how often the equipment turns on and off, alerting you to equipment failure before it occurs.

With EnviroSmarts there is no need for extra gateways or wireless repeaters. They're just expensive additional failure points in a wireless mesh network.

EnviroSmarts can connect to your building automation system and building security systems to improve functionality and response time.

It's your asset, protect it !
